

TRIPWIRE PURECLOUD

CLOUD-BASED VULNERABILITY SCANNING—SIMPLIFIED

Tripwire® PureCloud™ is the first network security scanning service that scans internal and perimeter networks without requiring additional hardware or software to be deployed. PureCloud combines Tripwire’s powerful enterprise class scanning technology with a secure, patent-pending cloud delivery model to scan both perimeter and internal networks. The service discovers and inventories devices, web applications and cloud environments, identifies where they are vulnerable and provides recommendations on how to secure them.

Prior to PureCloud, network security scanning has been largely inaccessible to smaller organizations. In order to accurately scan internal networks with previous solutions, organizations had to install hardware or software scanners on the internal network and potentially change firewall configurations. For smaller organizations, the expenditure and management of these options is a significant roadblock. PureCloud eliminates the need for these on-premise solutions; simply use a standard web browser, download a small PureCloud Secure Connector and scan the entire network. Scanning the network perimeter is even easier; simply login and scan.

RISK-BASED SECURITY MANAGEMENT SOLUTIONS

◆ Tripwire is a leading global provider of risk-based security and compliance management solutions that enable organizations to effectively connect security to the business. Tripwire delivers foundational security controls like security configuration management, file integrity monitoring, log and event management, vulnerability management, and security business intelligence with performance reporting and visualization. ◆
